

WHAT IS CLAIMED IS:

1. An indication device for remaining volume of a feeding bottle comprises:

a bottle body, having an accommodating space therein for holding milk liquid, and a plurality of scale lines, parallel to a horizontal line along the direction of a vertical line, being provided on one side face thereof, wherein numerals provided on said scale lines, served for displaying the volume, are step-up from downside to upside; a bottle cap part, one end of which has a nipple part penetrating through the center thereof, and the other end of which is screwed tightly onto a neck portion of said bottle body, the top end of said nipple part including an opening for releasing milk liquid, characterized in that:

a set of scale lines, parallel to each other and indicating different volumes along the direction of the vertical line, are provided on the other side face of said bottle body, and numerals provided on said scale lines, served for displaying the remaining volume, are step-up from upside to downside.

2. The indication device for remaining volume of a feeding bottle according to Claim 1, wherein a plurality of scale lines with different angles are included for providing on said remaining volume-displaying scale line of one and the same scale, and said scale lines with the same angle are parallel with each other.

3. The indication device for remaining volume of a feeding bottle according to Claim 1, wherein said numerals for the remaining volume indication are used for the unit of volume or weight.

4. The indication device for remaining volume of a feeding bottle according to Claim 2, wherein said plurality of scale lines with different angles intersect at a center point with a consistent angle.

5. The indication device for remaining volume of a feeding bottle according to Claim 2, wherein said several scale lines with different angles intersect at a center point with an inconsistent angle.

6. The indication device for remaining volume of a feeding bottle according to Claim 4, wherein the angles between said scale lines are presented between 5° and 45° .

7. The indication device for remaining volume of a feeding bottle according to Claim 5, wherein the angles between said scale lines are presented between 5° and 45° .
